Gell Cell Battery charger

Note: The output may float higher than 13.4v. Some brands of the LM317 IC need a minimum load. Add a 1K resistor across the output to prevent this.

LED will be on when the current is at max. It will turn off when it switches to float charge.

Use 0.47 ohm for 1.3 amp charge.

All resistors 1/4 watt except R1 (1 Watt or higher)

Adjust R4 for 13.4v out when use as a continuous charge. Set it to 13.8 for faster charging, but remove within a few hours after LED turns off.
